Assignment 1 – SRS
Due: 11.59 PM on Friday of Week 5 of the Semester
Submission: Electronic submission via Canvas

Swinsoft Consulting has been approached by a client, i.e., the management team of a local tourism association, to promote Sarawak as a tourism destination worldwide. Your team is required to design and develop a system that provides accommodation, transportation, food and other useful information for tourists to Sarawak, as well as enabling the management team to manage the information and databases.

The management of Swin Consulting requires you (i.e., your assignment team) to develop a requirements specification using the **Tasks and Support** approach to better assess the required development efforts (as well as associated costs). In doing so, you are requested to focus particularly on domain-level requirements (i.e., the tasks that users want/need to perform with the support of the envisaged system), as well as on the specific quality attributes (i.e., non-functional requirements) that the system must meet. In addition, the requirements specification should also contain information about the *context* of the system, appropriate domain requirements (e.g., a *simple* domain model – no database scheme!), as well as any requirements at the design and product levels (cf. the Goal-Design Scale discussed in the lectures) that you consider as being important. Furthermore, taking the identified user tasks and the application domain into consideration, identify and appropriately specify four quality attributes (i.e., non-functional requirements) that you consider *particularly important* for the Online system.

Here are some ground rules for the case study system:

- Think about what *type of project* the client is dealing with.
- Make sure that you identify the domain entities and their relationships and use the correct terminology in the requirements.
- Illustrate the project incentives and list the most important requirements at the *goal level*. Identifying the pain points of the existing processes helps.
- Carefully identify all actors of the proposed system
- Carefully identify and document the typical workflow of events of the proposed system.
- Your submission must illustrate any *validation steps* you have undertaken in the creation of the requirements specification. Please include evidence of such validation steps in a suitable Appendix.
- To avoid a too solution-oriented view of task descriptions, consider at least three *different* solutions to the problem and make sure that the task descriptions are applicable to each of your solutions.
- You are to elaborate only on the *software part* of the proposed system. Assume that any data repository, hardware or platform required to deploy the system and fulfill online operation can be acquired in due course.
- All assumptions made are to be documented.

Sample requirements specifications (from a different case study) will be made available on Canvas in due course as a guide to what form to use, etc. *(Note that these sample specifications do not necessarily represent the "best submission" in terms of proper structure, notations or practices. You should aim to come up with a better submission based on what you learned in this unit.)*

Marking guidelines on which aspects of your submission will contribute to the final mark, and how much, are posted on Canvas.

Please use the dedicated Canvas discussion forum for any further clarifications that benefit all; please do not send individual emails in this regard.

Submission details

Each assignment group submits its proposal electronically, along with the appropriately signed and completed **Assignment and Project Cover Sheet** declaration form (see below), *which all group members must sign*.

Each group is required to submit a **contribution document**, signed by *all* group members, that

1. lists the amount of time spent by each member on each significant part of the assignment and
2. provides evidence that the assignment is done through *true* group collaboration, e.g., discussions and mutual reviews of all parts of the assignment.

Note: For the assignments in this Unit of Study, students are to work in groups of three or four as allocated/agreed by the Tutor. Permission is required to change groups prior to the submission deadline. Extensions to the submission deadline can only be granted for genuine reasons, and the Unit of Study Convener must be contacted with supporting evidence ***at least 48 hours*** prior to the submission deadline.

Electronic submissions are through Canvas, with the deadline as published at the front of this assignment specification. **(No hardcopy submission is required.)**

Please read the Extensions, late penalties and special consideration section in the Unit Outline.

ASSIGNMENT AND PROJECT COVER SHEET

Subject Code: SWE30003 Unit Title: Software Architectures and Design

Assignment number and title: 1, Requirements Project Group No:_____

To be completed, as this is a group assignment
We declare that this is a group assignment and that no part of this submission has been copied from any other student's work or from any other source except where due acknowledgement is made explicitly in the text, nor has any part been written for us by another person.

ID Number	Name	Signature
